Here's the Intro to Photoshop Tutorial from Adam Pash If you are not familiar with the different programs on this list, you might want to check out our guide to the most popular graphics design software: How to Use Photoshop Elements Photoshop Elements has some of the most basic photo editing tools in the industry. You don't need any special software knowledge to use it. It has all the basic tools you need, without all the unnecessary complexity. That being said, you still need some knowledge of using a graphics editor to be successful with Photoshop Elements. You can use the keyboard shortcuts within Photoshop Elements to make editing your images faster and easier. We also have a dedicated post, Best Photoshop Elements Keyboard Shortcuts. When you are working on an image or design on your computer, you need to be ready to make quick changes. This includes resizing or cropping images. Make sure you have free space on your computer's hard drive for your photo editing project. A fast internet connection is important to get images from the internet to your computer. If you are using Windows, get an external hard drive for keeping your project data in another place, like your external hard drive. With Photoshop Elements you can crop your images right away, without waiting for Photoshop to ask for input. After cropping your images, you can edit them by trimming the edges, giving them a new look, and adding special effects. Trim, crop, or distort your images with a few simple steps. If you want to remove the edges of your images, trim your photos. Use the Trim tools to move the edges of your image to a new position, and automatically crop it so that it fits the frame. If you want to use the Image Trimmer to crop your image, then click the Trim tool, and select the blank spaces in your image, to trim the edges. If you want to use the Crop tool, a681f4349e

Q: Apache CXF configuration - missing Datanucleus JDO 4.1 provider I'm using Apache CXF 2.2.6 with my CXF plugin CXFJVersion to be sure that JDO 3 is used. I have no problems with spring-data-releasetemplate. However I run into problems with the JPA provider: I get the following error: Caused by: org.datanucleus.exceptions.NucleusException: Invalid JDO provider name: jbossdatanucleus-dmr. I do have Datanucleus JDO 4.1 provider installed. My CXF plugin - I added javax.persistence 1.0 as required dependency. In my CXF plugin I have an annotation: @XmlRootElement(name = "spring-mvc-cxf.service") public class SpringMvcCxfPlugin extends AbstractPlugin { @XmlAttribute protected String name; @XmlElement(name = "jaxrs") protected List jaxrs; @XmlElement(name = "rest") protected List rest; @XmlElement(name = "mvc") protected List mvc; } All the others classes that extend AbstractPlugin have the correct provider. In the Spring configuration, I have:

Q: Use a project which has no imports I have a project for my school, but it has no import statement. I want to use that project to create a new project for my school, but it gives me the error that my project does not have a main method. Any advice? A: You will need to import the classes of the project you want to import. For example if the project you're trying to import is called ProjectA then you need to do import ProjectA.*; You need to find out which classes it uses and then import them. You can write a static main method in your current project and then just copy and paste the code from ProjectA into your current project. Or you can give the classes you want to import to the program. If you're trying to reuse all of the code for the project in your new project (overriding the default import) then you'll need to use import MyProject.*; and use MyProject.main(); in your main method. And then the usual rules for using packages apply. Q: CUDA for speed in large matrix multiplication Background I'm attempting to write a CUDA kernel that multiplies 2 vectors of length N. Right now I have an working implementation using CUDA Thrust which returns a result with a speedup of about 6x over a CPU implementation using BLAS () and a CUDA runtime speedup of about 1.5x over the CPU implementation. From a purely algorithmic point of view there's no reason why I shouldn't be able to make it run faster in CUDA. Goal I'm trying to write a CUDA kernel that multiplies 2 large vectors of length N. I have the first part of the problem working () but I'm struggling with this one. The problem The GPU implementation has a runtime speedup of only 1.5x, and I'm struggling to figure out why it's running so slow. My code Here's a simplified version of what I'm working with: template __global__ void vec_mul(T* dst, T* src, int N){ unsigned int i = (blockIdx
