With the computer revolution in the 1980s, several problems confronted the user regarding an efficient and accurate document storage and retrieval system. The advent of a personal computer with a large memory capacity and an improved processor operating speed has mitigated many of the problems previously associated with document storage and retrieval. In the early days of the personal computer, a standard copy command would result in the entire document, or at least all of the text, being copied and saved onto the hard disk drive of the personal computer. When a user wanted to retrieve a document, the entire document would be brought back by the operating system or the word processor from the hard disk drive. Of course, the limitation here was that the documents saved had to be in some particular format. If the files were written using the word processor, the files had to be created on the hard drive using the word processor. If the files were generated or scanned on the personal computer, the files had to be created on the hard drive using an application specifically designed for the files. If the files were generated by a facsimile machine, the files had to be saved as a bitmap, a particular type of file format, for the facsimile machine to work. To make matters even more complicated, some applications, such as Adobe Acrobat, would allow a user to save a file in a non-standard format with the standard copy command, and the file would be saved on the hard disk drive without any additional action on the part of the user. Thus, the user would be faced with the problem of how to retrieve that file from the hard disk drive. To minimize the problems associated with storing and retrieving documents, the Document Imaging Service (DIS) project was developed by the Adobe Systems corporation. The Document Imaging Service project was directed to producing a networkable format for representing electronic data, known as Extensible Markup Language (XML) format. XML, or eXtensible Markup Language, is a simple, generic format that provides a flexible method for representing information in a manner that is both human-readable and machine-readable. The
