As the guy who runs Most Votes in America, the page that keeps track of which way each state has voted in each of the presidential elections since 1980, is today going to reveal where the states voted in 2008. Most Votes is, for many people, an end in itself. But what they can never predict (other than it'll be Obama) is what some random political nerd will do next. As luck would have

it, Michael has just taken a bit of a trip down to his niece's high school to do a little bit of guerilla campaigning. In eight paragraphs, he explains how to read his data, even providing some maps of state-by-state results for 2004 and 2000. And as one of my favorite political Twitter accounts, RedState, points out, the electoral map of the US is now courtesy of the Cornhuskers. Given how close the general election was in Minnesota, it's interesting to think that he might have won if he'd only turned out more voters on election day. Here's hoping that

he gets the results he's after —

TES - Text Encrypter is a handy tool that uses the Rijndael algorithm to encrypt your important or personal text blocks with a password, thus rendering it unreadable. This is also known as conversion from plaintext to ciphertext. Once a text or message was encrypted, it can be safely saved and stored, or sent to others, as anyone intercepting a communication channel will not be able to read its contents. Handy Rijndael encryptor for

texts TES - Text Encrypter gives you the possibility to choose the length of your password, which also increases security for longer ones. As Rijndael is a symmetric-key block cipher, the same password used for encryption is the same used for decryption. Although this might be seen as a disadvantage, this also means that the password cannot be found by processing the public key, which would be the case of asymmetric block ciphers. On top of that, the program is easy to use, meaning that you can quickly encrypt text regardless if you have no knowledge on how

cryptosystems work or you are accustomed with such notions. Conclusion To sum it up, TES - Text Encrypter provides you with a sturdy environment for encrypting texts using the Rijndael algorithm. Because it only provides a single encryption method, adding new ciphers and protection algorithms would surely improve the program, by offering users several ways of securing their data.
