Assassin's Creed.[@bib15].[@bib16].[@bib17].[@bib18] have rarely reported cases of growth in these thin walls. Radiotherapy has been performed on them with good results. This case, which occurred in a region of the tongue containing a large amount of adipose tissue, is unique. The soft-tissue mass, which appeared during the administration of the hormone therapy, was not associated with a mucosal lesion. The mass underwent significant growth after the cessation of the hormone therapy and it was possible to identify the epithelial origin of the mass by staining with cytokeratin and Ki-67. The histological features, including the diagnosis of a well-differentiated liposarcoma, were not associated with the use of the hormone therapy. One of the previous reports[@bib19] of a liposarcoma in a patient with familial multiple endocrine neoplasia did not mention a previous use of the hormone therapy. Because the liposarcoma could have been a remnant of a pre-existing lipoma and not a primary tumor that developed in response to the hormone therapy, it was necessary to assess the patient's medical history for the development of a liposarcoma before discussing the clinical features. A biopsy should be performed for definitive diagnosis because the liposarcoma can be confused with another kind of malignant soft-tissue neoplasm, such as a lipoma with atypical change.
